Fire protection BSF, BCC

1. The joint can be filled with rockwool, to be sealed with a fire resistant backing strip and fire resistant joint sealant.
2. The sides and bottom perimeter of the space between the beam end and column can be sealed with a backing strip (see memo 4), and the joint concreted. If it is desirable, a fire resistant joint sealant can be used to cover the backing strip. Alternatively the backing strip can be removed.
3. If required, the knife can be protected against corrosion with a layer of zinc.
